Distributeurs 146-148

The RC5

Average friction coefficient $\mu=0,4$.

Our last out coming material in our range is made for light car applications, endurance races thanks to its low wear rate, for low grip race conditions (Gravel, wet, standard tires...).

Fitted in rear axle, it helps to get the right brake balance when the brake bias adjustment is not possible.

Easy to use for a track day thanks to its low noise level, moderate and very stable friction level, effective from cold and gentle with OEM brake discs.

The RC8

Average friction coefficient $\mu=0,6$.

Since 2 years, this material gives an answer to all the most demanding high class race cars. (WRC, Nascar, WTCC, ZA V8, AWD GrpN...)

Very high and stable friction level which will shorten your

brake distances without locking the wheels.

This compound is to use only with other C.L. friction material.

The RC8 is also available with the grooved backing plate option.

The RC6

Average friction coefficient $\mu=0,5$.

The first out coming friction material was made 7 years ago to match a very large application range, in rally and circuit.

It can be used in almost every type of race car and provide a high and stable friction level.

The incompressible material gives a stiffer pedal and a better brake modulation.

Can be used front and/or rear combined with the RC5 and RC8.

The discs life is increased because no materials transfer.

-R option

Designed to provide a radiator effect, the contact area with the calliper is reduced and the heat better evacuated.

This patented shape is to use in case of brake liquid temperature issues and with ventilated brake system. (airducts).

The RC6 Endurance

Average friction coefficient $\mu=0,46$

New for 2008, the RC6 Endurance offers a fair level of grip combined with a very low disks/pads wear rate.

It makes you win pads changing during 6 to 24 hours races.

Like the entire product range, the bedding in process is easy and the performance very stable from cold to high temperature.

No specific process necessary.
With new discs: progressively warming up the brake system.

With bedded discs: a couple of middle brakings.
To be used with High quality brake fluid.

Bleed the brakes often.

Bedding in procedure

Full metallic friction compound.
Thermal resistant components: graphite, ceramic, iron, copper and bronze.
Environment friendly: no lead, no asbestos and no nickel (NoNiTech Technology).

Le RC5

Coefficient de friction moyen : $\mu = 0,40$.

Dernier né de la gamme, il convient parfaitement aux voitures légères (Formules monoplace), aux étriers arrières pour une bonne répartition de freinage ou pour des

conditions de courses avec peu de grip au sol.

Il offre des niveaux d'usure et de bruit très faibles.

Le RC6

Coefficient de friction moyen : $\mu = 0,50$.

Ce matériau a un très grand champ d'application possible, en rallye ou sur circuit.

Il fait gagner des courses depuis déjà 6 ans grâce à son rapport efficacité/facilité d'utilisation imbattable. Il offre une très grande

constance de friction à un niveau élevé. Son utilisation nécessite un liquide de frein de bonne qualité.

Le RC6 Endurance

Coefficient de friction moyen : $\mu = 0,46$

Nouveauté 2008, le RC6 Endurance offre un niveau de friction déjà élevé combiné à un niveau d'usure disque/plaquette très faibles. Il vous permet d'économiser des

changements de plaquettes pendant des courses de 6 à 24 heures.

Comme les 3 autres produits de la gamme, il se rode très facilement et garde une grande stabilité des performances à froid comme à chaud.

Le RC8

Coefficient de friction moyen : $\mu = 0,60$.

Ce matériau répond aux conditions de courses les plus exigeantes.

On le retrouve sur des voitures de compétitions de haut niveau (WRC, WTCC, ZA V8, GT....)

Il convient aux systèmes de

freinage "groupe A" et est à utiliser avec un liquide de frein hautes performances. Sa résistance à l'usure est accrue par rapport au RC6.

Il est systématiquement proposé avec le système radiateur sous forme de rainures dans le dos des plaquettes.

Option -R

Ce rainurage du dos de la plaquette apporte un effet radiateur. La chaleur est mieux évacuée et la surface de contact avec l'étrier réduite.

Ce principe breveté est utile avec un système bien ventilé ou en cas de problèmes d'ébullition du liquide frein.

Pas de rodage spécifique nécessaire.
Sur disques neufs: faire chauffer progressivement

Procédure de rodage

Sur disques rodés: quelques freinages moyens.
Utiliser avec du liquide de frein haute qualité.
Purger souvent les freins.
Matériau de friction

en métal fritté.

Principaux composants : graphite, céramique, fer, cuivre et bronze.

Préservation de l'environnement : pas de plomb, pas d'amiante, pas de nickel (technologie NoNitech).
